TYPE: DNA
CRANISM: Homo sapiens
CRANISM: Homo sapiens
CRANISM:
CREATURE:
COTHER INFORMATION: DISO7_10007639
FEATURE:
COTHER INFORMATION: Located on chromosome 1
COTHER INFORMATION: Chromosomal short arm and 5'-terminus of this base
COTHER INFORMATION: Sequence: 5692908
FEATURE:
COTHER INFORMATION: Distance between 3'-terminus of neighbour sequence of
COTHER INFORMATION: Sequence listing upward to telomere on chrosomal short arm and
COTHER INFORMATION: Sequence listing upward to telomere on chrosomal short arm and
COTHER INFORMATION: S'-terminus of this base sequence: 168636

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 6, A

Sequence 1. Application US/10289762

Sequence 1. Application US/10289762

GENERAL INFORMATION:

APPLICANT: Griffais, F.

TILLE OF INVENTION: Chlamydia pneumoniae genomic sequence and polypeptides, fragment:
TILLE OF INVENTION: thereof and uses thereof, in particular for the diagnosis, previritle OF INVENTION: and treatment of infection
FILE REFERENCE: 9710-003-999

CURRENT APPLICATION NUMBER: US/10/289,762

CURRENT FILING DATE: 2003-03-27

NUMBER OF SEQ ID NOS: 6849

SEQ ID NO 1

LENGTH: 1230025
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FEATURE:

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Control plasmid, useful as internal standard in amplification method for detecting Mycoplasma, contains primers that recognize parts of the Mycoplasma 16S rRNA gene.

Claim 2; Page 15; 25pp; German.

The invention relates to a control plasmid (A) containing: (a) primers that recognize a segment of the 16S rRNA-encoding gene in the Mycoplasma segmence (i) and (b) between the primers an amplicon that includes the sequence (i). (A) is used as a control in a PCR method for detections of Mycoplasma in biological materials, e.g. for diagnosing infections or control for PCR detection of cell cultures. (A) provides an internal control for PCR detection of Mycoplasma to exclude false negatives. The method is more sensitive and specific than known processes, providing reliable detection of even very low titers of Mycoplasma and when used in real-time PCR, has a broad dynamic and linear measurement range, allowing accurate quantitation. The present sequence is that of a Mycoplasma 16S rNNA gene PCR primer of the invention

```
The present invention describes a method for identifying a microorganism by comparing a composite sequence (I) of a ribosomal RNA gene region with a sequence of unknown microorganisms in a database and identifying the region in the database that matches with (I). (I) is generated by simultaneously obtaining nucleotide base sequence data from every copy of the rRNA gene region in the genome of the unknown microorganism. Also described is a method for identifying the species of microorganism by generating (I) and entering it into a first data register of a programmable computer, comparing the first data register with reference data registers that encode a unique composite rRNA sequence corresponding to (I) and correlated with unique microorganism species name, and displaying the unique microorganism name ocorrelated with the best matching first data register. The method is useful for identifying microorganisms which are useful in a variety of fields including human medicine, veterinary medicine, agriculture, food science and industrial microbiology. The microorganisms found in patients suffering from an infectious disease can also be identified.
                                                                                                                                                                                                                                                                                                                                                                                                           Bacterial; 16S rRNA; identification; polymorphism; microorganism; classification; primer; human medicine; veterinary medicine; agriculture; food science; industrial microbiology; infectious disease; food safety;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying an unknown microorganism by generating a composite sequence of its ribosomal RNA gene region and comparing with composite ribosomal RNA region sequences of distinct microorganisms in a database.
                                                                                         ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel device for detecting analytes in a sample. The device comprises a carrier surface which contains at least one analytical region (including at least one immobilised binding partner for the analyte) and at least one control region which controls of the quality of analysis. The device is particularly used for nucleic acid amplification and detection of (i) bacterial species associated with parodontitis, (ii) gene expression patterns and (iii) single-nucleotide polymorphisms (SNP's). The device provides reproducible, rapid and simple exactly the same series of operations as the analytical regions, so no extra time for the control step is required and system costs are not significantly more than for analysis without a control. If the device is stored for archiving, the control results are also saved. Many different analytes can be detected simultaneously and controls for many different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         aspects of analytical quality can be included. This sequence represents an oligonuclectide associated with the detection of 165 rRNA from various bacterial samples, which is used to illustrate the device of the

                                                                                                            a
```

testing for pathogens. Plants harbouring phytopathogenic bacteria are also identified. The method is convenient and efficient as there is no need to isolate one or more individual 16S rRNA genes. AAA39023 to AAA3039 represent primers for the 16S rRNA gene, which are used in the exemplification of the present invention

```
Nucleic acid probes - specific for RNA of Eubacteria, for use in clinical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Probes allow assay for Bubacteria to be carried out in clinical samples such as blood or urine, in a cost effective and fast manner. The probes require only small sample sizes which may be amplified, with some of the probes suitable as primers. (Updated on 09-JAN-2003 to add missing OS field.) (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detection, microorganism, 16S rDNA, 16S rRNA, identification, gene, microbial encephalitis, viral encephalitis, ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel device for detecting analytes in a sample. The device comprises a carrier surface which contains at least one analytical region (including at least one immobilised binding partner for the analyte) and at least one control region which controls of the quality of analysis. The device is particularly used for nucleic acid amplification and detection of (i) bacterial species associated with parodontitis, (ii) gene expression patterns and (iii) single-nucleotide polymorphisms (SNP's). The device provides reproducible, rapid and simple analysis of rucleic acid sequences. The control system is subjected to exactly the same series of operations as the analytical regions, so no extra time for the control step is required and system costs are not significantly more than for analysis without a control. If the device is stored for archiving, the control results are also saved. Many different analytes can be detected simultaneously and controls for many different analytes an oligomucleotide associated with the detection of 165 rRNA from various bacterial samples, which is used to illustrate the device of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Device for determining analytes, useful e.g. for detecting bacteria that cause parodontitis, comprises a surface with immobilized analytical and control agents.
                                                                                                                                                                                                                                                                      Probe; detection; primer; 16S rRNA; amplification; parodontitis; SNP; gene expression pattern; single-nucleotide polymorphism; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present invention describes a mechanical content in a sample, comprising amplifying a target nucleotide sequence which is substantially conserved amongst 2 or more species of microbial content in a sample, conserved amongst 2 or more species of microorganisms. Also describes is an isolated polynucleotide (I) or its complement having a nuclectide sequence which is comprised by 16S rDNA or 16S rRNA, substantially conserved amongst two or more species of microorganism. (I) can be used: (I) as a primer or probe for determining the total microbial content in a sample; (2) as a primer or probe for identifying a microorganism by its genus in a sample; and (3) as a probe for identifying a microorganism by its genus in a sample; and (3) as a probe for identifying a microorganism by its genus in a sample; and (3) as a probe control microbial derived target material; in assessing encephalitis and identify microorganisms at the genus or species level, and as a trap for identify microorganisms at the genus or species level, and as a trap for identify microorganism and viral encephalitis. (I) is applicable to a range of industries including the medical, adricultural and user and the microbial and viral encephalitis. (I) is and industrial industries with specific uses including enviroprotection, bloremediation, medical diagnosis, water quality control or food quality control. (I) provides an ability to detect bacteria from samples which undetected or under-estimated by viable culture count methods and enables rapid differentiation of bacteria from viral infections within the clinical situations. ABLS902 to ABLS9821 represent les rDNA fragments, and in the

The present invention describes a method for determining the total microbial content in a sample, comprising amplifying a target nucleotide sequence which is substantially conserved amongst 2 or more species of microorganisms. Also describes is an isolated polynucleotide (I) or its complement having a nucleotide sequence which is comprised by 16S rDNA or 16S rENA, substantially conserved amongst two or more species of microorganism. It is an a sample, (2) as a primer or probe for identifying a microorganism by its genus in a sample, and (3) as a probe for identifying a particular microorganism or prevalence of a particular genus or species of microorganism by its genus in a sample, and (3) as a probe for identifying a particular microorganism or prevalence of a particular genus or species of microorganism or prevalence of a particular genus or species of microorganism, in a sample, (1) can also be used to identify microbial and viral encephalitis. (1) is applicable to a range of industries including the medical, agricultural applicable to a range of industries including the medical, agricultural biconemication, medical diagnosis, water quality control or food quality control. (1) provides an ability to detect bacteria from samples which repetited or under-estimated by viable culture count methods and enables rapid differentiation of bacteria from viral infections within the rapid of the particular of the partic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    limited time constraints sometimes experienced in life-threatening

The present invention describes a method for determining the total microbial content in a sample, comprising amplifying a target nucleotide sequence which is substantially conserved amongst 2 or more species of microorganisms. Also describes is an isolated polynucleotide (1) or its complement having a nucleotide sequence which is comprised by 168 rDNA or 168 rRNA, substantially conserved amongst two or more species of microorganism. (1) can be used: (1) as a primer or probe for determining the total microbial content in a sample; (2) as a primer or probe for identifying a microorganism by its genus in a sample; and (3) as a probe for identifying a microorganism by its genus in a sample; and (3) as a probe for identifying a microorganism by its genus in a sample; and (3) as a probe for identifying a microorganism by its genus or prevalence of a particular correct an microbial-derived target material; in asample; and sa a trap for identify microbial-derived target material; in can assessing encephalitis and distinguishing between microbial and viral encephalitis. (1) is applicable to a range of industries including the medical, agricultural advisition didistries with specific uses including enviroprotection, bioremediation, medical diagnosis, water quality control or food quality control. (1) provides an ability to detect bacteria from samples which industrial to cultivate and that would in all practically remain undetected or under-estimated by viable culture count methods and enables rapid differentiation of bacteria from viral infections within the limited ime constraints sometimes experienced in life-threatening clinical situations. ABIS9702 to ABIS9821 represent 16s rDNA fragments, exemplification of the present invention
                                                            Polynucleotide useful as primer or probe for determining microbial content in sample, has sequence which is comprised by 16S rDNA or 16S rRNA, substantially conserved amongst two or more species of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detection, microorganism; 16S rDNA; 16S rRNA; identification, gene, microbial encephalitis; viral encephalitis; ds.

The present line describes a meriou for determining the recent microbial content in a sample, comprising amplifying a target nucleotide sequence which is substantially conserved amongst 2 or more species of microbian anucleotide sequence which is comprised by 16s rbNa compresent having a nucleotide sequence which is comprised by 16s rbNa or 16s rRNa, substantially conserved amongst two or more species of microbial content in a sample; 13 as a primer or probe for determining the total microbial content in a sample; 13 as a primer or probe for dentifying a microbial micropianism or prevalence of a particular of for identifying a particular microorganism; in a sample; (1) can also be used to identify microorganisms at the genus or species level, and as a trap for total microbial derived target material; in assessing encephalitis and distinguishing between microbial and viral encephalitis. (1) is applicable to a range of industries including the medical, agricultural and industries with specific uses including enviroprotection, bioremediation, medical diagnosis, water quality control or food quality control. (1) provides an ability to detect bacteria from samples which are difficult to cultivate and that would in all practicality remain cunderected or under-estimated by viable culture count methods and enables rapid differentiation of bacteria from viral infections within the limited time constraints sometimes experienced in life-threatening clinited time constraints experienced in life-threatening clinited limited is represent primers and probes, used in the
                                                         Polynuclectide useful as primer or probe for determining microbial content in sample, has sequence which is comprised by 16S rDNA or 16S rNNA, substantially conserved amongst two or more species of

microbial content in assmile, comprising amplifying a target nucleotide sequence which is substantially conserved amongst 2 or more species of microorganisms. Also describes is an isolated polynucleotide (1) or its complement having a nucleotide sequence which is comprised by 16S rDNA or 16S rRNA, substantially conserved amongst two or more species of microorganism. (1) can be used: (1) as a primer or probe for determining the total microbial content in a sample; (2) as a primer or probe for identifying a microorganism by its genus in a sample; and (3) as a probe for identifying a microorganism by its genus in a sample; and (3) as a probe for identifying a particular microorganism or prevalence of a particular genus or species level, and as a trap for identify microbial-derived target material; in assessing encephalitis and identify microbial-derived target material; in assessing encephalitis and distinguishing between microbial and viral encephalitis. (1) is applicable to a range of industries including the medical, agricultural and industrial industries with specific uses including enviroprotection, bloremediation, medical diagnosis, water quality control or food quality control. (1) provides an ability to detect bacteria from samples which undetected or under-estimated by viable culture count methods and enables capital affections. ABLS9821 represent lefs round in the infections within the limited time constraints sometimes experienced in life-threatening control of the present primers and probes, used in the constraint of the property of the primers and probes, used in the
                                                          Polynucleotide useful as primer or probe for determining microbial content in sample, has sequence which is comprised by 16S rDNA or 16S rRNA, substantially conserved amongst two or more species of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detection, microorganism; 16S rDNA; 16S rRNA; identification; gene; microbial encephalitis; viral encephalitis; ds.
                                                                                                                                                                                                             The present invention describes a method for determining the total

microbial content in a sample, comprising amplifying a target nucleotide sequence which is substantially conserved amongst 2 or more species of microorganisms. Also describes is an isolated polynucleotide (1) or its complement having a nucleotide sequence which is comprised by 165 rDNA or 165 rRNA, substantially conserved amongst two or more species of microorganism. (1) can be used: (1) as a primer or probe for determining the total microbial content in a sample; (2) as a primer or probe for dentifying a microorganism by its genus in a sample; and (3) as a probe for identifying a microorganism, in a sample; (1) can also be used to identifying a particular microorganism, in a sample; (1) can also be used to identify microorganisms at the genus or species level, and as a trap for total microbial-derived target material; in assessing encephalitis and distributing between microbial and viral encephalitis. (1) is carriagisable to a range of industries including the medical, agricultural and industrial industries with specific uses including enviroprotection, bioremediation, medical daganosis, water quality control or food quality control. (1) provides an ability to detect bacteria from samples which are difficult to cultivate and that would in all practicality remain and affice and an enables of the province of the control or control or food quality or and afficult to cultivate and that would in all practicality in the nables of the control or food and enables or the control or food province of the control or foo

Polynucleotide useful as primer or probe for determining microbial content in sample, has sequence which is comprised by 168 rDNA or 168 rRNA, substantially conserved amongst two or more species of

WPI; 2002-404428/43.

The present invention describes a method for determining the total

microbial content in a sample, comparising amplifying a target nucleotide microbial content in a sample, comparising amplifying a target nucleotide comparisons. Also describes is an isolated polynucleotide (I) or its complement having a nucleotide sequence which is comprised by 165 rDNA or 165 rENA, substantially conserved amongst two or more species of microorganism. (I) can be used: (1) as a primer or probe for determining the total microbial content in a sample; (2) as a primer or probe for determining the total microbial content in a sample; (2) as a primer or probe for determining the total microbial content in a sample; and (3) as a probe for determining the total microbial content in a sample; and (3) as a probe for determining a microbial content in a sample; and (3) as a probe for determining the total microbial and incorporation. (I) can also be used to identify microorganisms at the genus or species level, and as a trap for otal microbial-derived target material; in assessing encephalitis and distinguishing between microbial and viral encephalitis. (I) is applicable to a range of industries including the medical, agricultural applicable to a range of industries including the medical, agricultural control, medical diagnosis, water quality control or food quality control. (I) provides an ability to detect bacteria from samples which care difficult to cultivate and that would in all practicality remain cundetected or under-estimated by viable culture count methods and climited time constraints sometimes experienced in life-threatening climited the constraints sometimes experienced in life-threatening climited the constraints sometimes experienced in life-threatening climited situations. ABLS99021 to ABLS9921 represent 165 rDNA fragments, very complification of the present invention
The present invention describes a method for determining the total

microbial content in a sample, comprising amplifying a target nucleotide

sequence which is substantially conserved amongst. 2 or more species of

microorganisms. Also describes is an isolated polynucleotide (I) or its

complement having a nucleotide sequence which is comprised by 16S rDNA or

CS STRNA, substantially conserved amongst two or more species of

microorganism. (I) can be used: (I) as a primer or probe for determining

the total microbial content in a sample; (2) as a primer or probe for

continuitying a microorganism by its genue in a sample. (I) as a primer or probe for

dentifying a microorganism, in a sample. (I) can also be used to

content species of microorganism, in a sample. (I) can also be used to

content microbial-derived target material; in assessing encephalitis and

content microbial-derived target material; in assessing encephalitis and

distinguishing between microbial and viral encephalitis. (I) is

control. (I) provides an ability to detect bacteria from samples which

are difficult to cultivate and that would in all practicality remain

undetected or under-estimated by viable culture count methods and enables

replied differentiation of bacteria from viral infections within the

rapid differentiation of bacteria from viral infections within the

limited time constraints.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              limited time constraints sometimes experienced in life-threatening clinical situations. ABL59702 to ABL59821 represent 16S rDNA fragments, and ABL59822 to ABL59830 represent primers and probes, used in the exemplification of the present invention
                                                                                                                      Polynucleotide useful as primer or probe for determining microbial content in sample, has sequence which is comprised by 16S rDNA or 16S rRNA, substantially conserved amongst two or more species of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 50 BP; 14 A; 13 C; 16 G; 7 T; 0 U; 0 Other;

Polynucleotide useful as primer or probe for determining microbial content in sample, has sequence which is comprised by 16S rDNA or 16S rRNA, substantially conserved amongst two or more species of WPI; 2002-404428/43 

Example 12; Fig 1C; 101pp; English.

complement in a sample, comprising amplifying a target nucleotide sequence which is substantially conserved amongst 2 or more species of microbial content in a sample, conserved amongst 2 or more species of complement having a nucleotide sequence which is comprised by 165 rDNA or 165 complement having a nucleotide sequence which is comprised by 165 rDNA or 165 rRNA, substantially conserved amongst two or more species of microorganism. (1) can be used: (1) as a primer or probe for determining the total microbial content in a sample; (2) as a primer or probe for dentifying a microorganism by its genus in a sample; and (3) as a probe for identifying a microorganism by its genus in sample; and (3) as a probe for identifying a microorganism by its genus or prevalence of a particular genus or species level, and as a trap for identify microorganisms at the genus or species level, and as a trap for identify microorganisms at the genus or species level, and as a trap for identify microbial-derived target material; in assessing encephalitis and distinguishing between microbial and viral encephalitis. (1) is a applicable to a range of industries including enviroprotection, bloremediation, medical diagnosis, water quality control or food quality control. (1) provides an ability to detect bacteria from samples which undetected or under-estimated by viable culture count methods and enables capital situations. ABL59702 to ABL59821 represent lefs rbnA fragments, and abL59822 trapresent lefs rbnA fragments, and infinite constraints sometimes experienced in life-threadening capital contents. present invention describes a method for determining the total exemplification of the present invention

Martin FE, Nadkarni MA; Hunter N, Jacques NA,

Polynucleotide useful as primer or probe for determining microbial content in sample, has sequence which is comprised by 16S rDNA or 16S rNA, substantially conserved amongst two or more species of nicroorganism.

Example 12; Fig 1C; 101pp; English.

microbial content in a sample, comprising amplifying a target nucleotide sequence which is substantially conserved amongst 2 or more species of microbial content in a sample, comprising amplifying a target nucleotide sequence which is comprised (1) or its complement having a nucleotide sequence which is comprised by 16s rDNA or 16s rBNA, substantially conserved amongst two or more species of microorganism. (1) can be used: (1) as a primer or probe for of elemtifying a microorganism by its genus in a sample; and (3) as a primer or probe for cidentifying a microorganism by its genus in a sample; and (3) as a probe for identifying a microorganism in a sample; and (3) as a probe for identifying a microorganism or pevalence of a particular correct in a sample; and (3) as a primer or probe for total microbial derived target material; in assessing encephalitis and distinguishing between microbial and viral encephalitis. (1) is a splicable to a range of industries including the medical, agricultural continual industrial industries with specific uses including enviroprotection, bloremediation, medical diagnosis, water quality control or food quality control. (1) provides an ability to detect bacteria from samples which included difficult to cultivate and that would in all practicality remain undetected or under-estimated by viable culture count methods and enables of industrial from samples which in the control of paretrial from viral infections within the control of paretrial from samples. time constraints sometimes experienced in life-threatening l situations. ABL59702 to ABL59821 represent 16S rDNA fragments, 9822 to ABL59830 represent primers and probes, used in the invention describes a method for determining the total exemplification of the present invention The present clinical imited
